Ticket Office Assignment – Optional

Continue the Console app by improving the functionality for requesting user responses to age and place preference.

Keep asking the user to enter data until the response is satisfying.

The app should have two additional methods from the previous requirements:

• GetCustomerAge
• GetCustomerPlacePreference

The **GetCustomerAge** method should check if the string contains numbers

Loop until a good result is gotten. Consider the range for an age as being 1–3 char in length (a person could be 9 years old or 103 years old.) The Char class has a method for determining if the char is a number. Try to figure out how to check the string.

Method parameters:
No parameters

Return value: int

The **GetCustomerPlacePreference** method

Loop until a good result is gotten. Allow the customer to use both upper case and lower case letters. Enforce that the result returned is either "Seated" or "Standing".

Method parameters:
No parameters

Return value: string
